Reporting API

e-Invoicing Sandbox Release (2.1.0) 1.0.0 OAS 3.0.1

ZATCA wants to provide Taxpayers and Developers of Taxpayer e-invoicing solutions and devices the opportunity to test the integration of the systems with a ZATCA Sandbox environment prior to the launch of the production system. The Integration Sandbox (ISB) should enable solution developers to simulate the integration calls/requests that will be required later as part of the registration process and the submission of e-invoices, credit and debit notes to the production system. The Sandbox backend will accordingly simulate the validations and responses as part of the Cryptographic Stamp Identifiers issuance, renewal and revocation as well as the Reporting and Clearance function.

Although the ISB will give ZATCA an indication of the adoption rate for e-invoicing solutions in the market, it will not be mandatory to complete Sandbox testing as a pre-requisite for Registration/Taxpayer onboarding or accessing the production system. Similar to the Compliance and Enablement Toolbox (CET), the ISB is also aimed at Developers to build/update their solutions which are in line with ZATCA specifications and standards and are able to integrate with a ZATCA backend. Accordingly access to the ISB test/mock APIs will not be limited to Taxpayers and any user can register for a Developer account to access the ISB test/mock APIs and associated documentation. This registration will enable ZATCA to monitor the solution providers who intent to develop/update their solutions to integrate with ZATCA.

It should be noted that although the ISB will simulate most of the core functionalities of the production system, any validations that require integrations/access with external systems and/or storage as well as scenarios involving any backend exceptional handling (for example overriding the clearance process) will not be part of the ISB and will be covered by the core solution. Accordingly the ISB should not be considered as representative of all integrations and/or APIs that will be part of the production system.

Kindly note that validations which can result in an UBL XSD error also apply to optional fields if the tag is present and data input is not compliant. This includes leaving such fields blank. However if the tag itself is absent than the validations will not be performed.

This swagger documents the set of apis for the Sandbox (ISB) solution.

Developers can also refer to section 2.3.10 of the Developer Portal User Manual for additional guidance and steps.

Reporting Model Endpoint(s)

POST /invoices/reporting/single Reports a single invoice.

Reports a single SIMPLIFIED invoice credit note, or debit note. Specifically, it accepts simplified invoice, credit note, or debit note encoded in base64 and validates it to ensure:

1. Compliance to the UBL2 XSD.

2. EN 16931 Rules set.

3. KSA Specific Rules set.

KSA Rules set will override EN 16931 Rules set in case the same rule exists in both sets.

4. QR Code validation

5. Cryptographical Stamp validation

6. Previous Invoice Hash Validation (PIH)

Parameters

Name	Description
Authorization `string` *(header)*	Username (Production Certificate) and Password (Secret) should be taken from the Productin certificate response and put in the Authorize popup : - Username: 'binarySecurityToken' which represnts the Production Certificate - Password: 'secret' Authorization
accept-language `string` *(header)*	Specifies the langauge in which the response will be returned. Currently supported languages are English (en) and Arabic (ar) and it defaults to English. **Examples:** en ar
Clearance-Status * required `string` *(header)*	Specifies the clearance status, while "0" when clearance is disabled and "1" when clearance is enabled **Examples:** 0 1
Accept-Version * required `string` *(header)*	V2

Request body required

Responses

Code **Description** **Links**

200

HTTP OK. Returned on successful validation of simplified invoice.

Media type

application/json

Example Value | Reported

```
{"validationResults":{"infoMessages":[{"type":"INFO","code":"XSD_ZATCA_VALID","category":"XSD validation","message":"Compli
ed with UBL 2.1 standards in line with ZATCA specifications","status":"PASS"}],"warningMessages":[],"errorMessages":[],"sta
tus":"PASS"},"reportingStatus":"REPORTED"}
```

202

HTTP Accepted. Returned when the invoice is reported with warnings

Media type

application/json

Example Value | Reported

Code Description **Links**

```
{"validationResults":{"infoMessages":[{"type":"INFO","code":"XSD_ZATCA_VALID","category":"XSD validation","message":"Complied with UBL 2.1 standards in line with ZATCA specifications","status":"PASS"}],"warningMessages":[{"type":"WARNING","code":"BR-CO-17","category":"EN_16931","message":"VAT category tax amount (BT-117) = VAT category taxable amount (BT-116) x (VAT category rate (BT-119) / 100), rounded to two decimals.","status":"WARNING"},{"type":"WARNING","code":"BR-KSA-98","category":"KSA","message":"[BR-KSA-98] - The simplified invoice should be submitted within 24 hours of issuing the invoice.","status":"WARNING"}],"errorMessages":[],"status":"WARNING"},"reportingStatus":"REPORTED"}
```

400 HTTP Bad Request. Returned when the submitted request is invalid.

Media type

application/json

Example Value | Invalid Invoice Hash

```
{"validationResults":{"infoMessages":[{"type":"INFO","code":"XSD_ZATCA_VALID","category":"XSD validation","message":"Complied with UBL 2.1 standards in line with ZATCA specifications","status":"PASS"}],"warningMessages":[],"errorMessages":[{"type":"ERROR","code":"invalid-invoice-hash","category":"INVOICE_HASHING_ERRORS","message":"The invoice hash API body does not match the (calculated) Hash of the XML","status":"ERROR"},{"type":"ERROR","code":"invoiceHash_QRCODE_INVALID","category":"QRCODE_VALIDATION","message":"Invoice xml hash does not match with qr code invoice xml hash","status":"ERROR"}],"status":"ERROR"},"reportingStatus":"NOT_REPORTED"}

```

401 Returned when username and password are not added or added as wrong values.

Media type

application/json

Example Value | Unauthorized

```
{"timestamp":1654514661409,"status":401,"error":"Unauthorized","message":""}
```

Code	Description	Links

406

Returned when accept version header is anything other than V2

Media type

text/plain;charset=UTF-8

Example Value | **Not Acceptable**

```
"This Version is not supported or not provided in the header."
```

409

Invoice was already Reported successfully earlier.

Media type

application/json

Example Value | **Invoice was already Reported successfully earlier**

```
{"validationResults":{"infoMessages":[],"warningMessages":[],"errorMessages":[{"type":"ERROR","code":null,"category":nul
l,"message":"Invoice was already Reported successfully earlier.","status":"ERROR"}],"status":"ERROR"},"reportingStatus":"NO
T_REPORTED"}
```

500

HTTP Internal Server Error. Returned when the service faces internal errors.

Media type

application/json

Example Value | **Internal Server Error**

```
{"category":"HTTP-Errors","code":"500","message":"Something went wrong and caused an Internal Server Error."}
```

Schemas

InfoModel {

description:	An object representing the result of the clearance or reporting API endpoints when the clearance flag is turned on or off. Basically, it shows an informational message instructing the client to see the other api.
message	string

}

ErrorModel {

description:	An object representing the structure of the error object returned by the API endpoints. Specifically, it includes the Category of the error, its code and message.
category	string
code	string
message	string

}

WarningModel {

description:	An object representing the structure of the warning object returned by the API endpoints. Specifically, it includes the Category of the warning, its code and message.
category	string
code	string
message	string

}

validationResultsModel {

description:	An object representing the structure of the validation results returned by the API endpoints. Specifically, it includes the invoice hash, status, and lists of info, warning, and error messages.
